

Jessy Ssebuliba

Software engineer — Web3, frontend and distributed ledger systems

I have been building across the web for the past four years, and for the last two I have worked actively in the Web3 ecosystem, most prominently as a committer at hiero-ledger, the distributed ledger stack hosted by LF Decentralized Trust. My work runs from Solidity contracts and wallet integrations through to the libraries and frontends that other developers build on, most recently Hiero Enterprise JS.

Experience

2022 – present

Open Elements GmbH

Sept 2024 – present

Software engineer *remote*

- I work across Open Elements' open-source portfolio, primarily on the Hiero ledger ecosystem.
- I build and maintain the official Hiero website in Next.js, TypeScript and Tailwind CSS, including its content tooling and theming.
- I contribute to the Hiero JavaScript SDK, the most widely used of the Hiero SDKs, where every change is reviewed in public under Apache-2.0 governance.
- I contribute to Eclipse Adoptium's next-generation website.

Timato GmbH

Apr 2024 – Sept 2025

Frontend developer, part-time *remote*

- I built a client-facing case management application for a law practice in Vue.js and Buefy, and I owned the interface work from the first component to release.

OpenMRS

May – Sept 2024

Google Summer of Code intern *remote*

- I designed and shipped a frontend module that brought real-time SMS messaging between clinicians and patients into OpenMRS 3, for health facilities working with unreliable connectivity.

OpenMRS

May – Sept 2023

Google Summer of Code intern *remote*

- I rebuilt the responsive and tablet layouts across the OpenMRS 3 micro-frontend application, so that the clinical interface worked on the devices clinicians actually use at the point of care.

Web3 engineering

what I know deeply

Hiero and Hedera at platform level. I work with fungible and NFT token lifecycles, consensus-service topics, contract calls, key management and mirror-node reads, and I have abstracted that whole surface into a library that other teams now build on. In products I enforce on-chain ownership rather than promising it in the copy, and I keep read paths fast by querying the mirror node.

Solidity and the EVM. I write, test and deploy contracts, and I read them critically for gas and storage behaviour, access control and the common failure patterns.

Wallet integration and security. I connect wallets such as HashPack over WalletConnect, keep operator keys and secrets off the client, and leave signing authority with the wallet so that every transaction is shown in full before approval, which is what stops blind signing.

Selected project

Dino — a blockchain-backed pixel runner

2025

github.com/Jexsie/DINO Hedera Africa Hackathon

A retro endless runner built to make digital ownership tangible. Players connect a HashPack wallet over WalletConnect, apply NFT skins they own to change the game's theme, and mint an NFT through a smart contract when they beat the high score. Those assets stay with the player and can be verified on the mirror node outside the game.

Open source

roles and
maintainership

Hiero — LF Decentralized Trust

Jan 2025 – present

Committer

- I hold review and merge rights on the Hiero website repository, and I am an active contributor to the Hiero JavaScript SDK and to the other tools that enable the ecosystem.

Hiero Enterprise JS

creator, maintainer

TypeScript monorepo, Apache-2.0 github.com/hiero-hackers/hiero-enterprise-js

- It removes the glue code between the Hiero SDK and a real Node.js service, so Express, Fastify and NestJS applications get typed access to accounts, tokens, NFTs, contracts and topics with no client setup.
- It separates the write path (`enterprise-core`, holding the network client and operator keys) from the read path (`enterprise-mirror`, a zero-dependency mirror-node client with pagination, filters and rate limiting) and presents both behind one interface, with CI, coverage reporting and an OpenSSF Scorecard.

Open Data Ensemble

contributor

Formulus, an offline-first mobile form engine

- I contribute native mobile work to the form engine that field teams use to collect data on Android and iOS where connectivity is unreliable, syncing through the Synkronus backend.

Eclipse Adoptium

Jan 2025 – present

Contributor

- I contribute to the Adoptium website, the front door through which developers find and download the Temurin JDK.

Recognition

and certification

Hiero bounty winner at the Hedera Hello Future: Apex hackathon.

2026

The winning entry was Hiero Enterprise JS, which ships ready-to-use functions and removes the boilerplate needed to set up a client and perform transactions.

Track winner at the Hedera Hello Future Hackathon 2.0.

2024

The winning entry was Noobisoft, a mini-game rewarding players in NFTs to show how digital ownership can be enforced on-chain.

I was selected twice for Google Summer of Code with OpenMRS.

2023, 2024

I am a Certified Hedera Developer and an active learner at Cyfrin Updraft, where my progress is listed at profiles.cyfrin.io/u/jexsie.

Skills

and languages

Core	TypeScript, JavaScript, Solidity, React, Next.js, Vue.js, Node.js, React Native, Tailwind CSS
Ledger and Web3	Hiero and Hedera SDKs, token and NFT services, consensus service, mirror node APIs, EVM, smart contracts, WalletConnect, HashPack
Architecture and testing	Micro-frontends with single-spa, Express, Fastify, NestJS, monorepos, Cypress, Playwright, Selenium, GitHub Actions
Spoken	English and Luganda fluently, Swahili conversationally
