CURRICULUM VITAE

Jessy Ssebuliba

Software Engineer — Web3, distributed ledger and decentralized identity

Kampala, Uganda (EAT, UTC+3) · jessiessebuliba@gmail.com · +256 754 544829
jexsie.com · github.com/Jexsie · linkedin.com/in/jexsie · profiles.cyfrin.io/u/jexsie

Software engineer working across the Web3 stack — from Solidity contracts and wallet integrations up to the SDKs, middleware and decentralized applications other teams build on. I am a committer on Hiero at LF Decentralized Trust, I created and maintain Hiero Enterprise JS, and I contribute to EUDIPLO, the LF Decentralized Trust middleware for the European Digital Identity Wallet. My interface work is application engineering — stateful, wallet-connected, transaction-driven UI — not content sites.

EXPERIENCE

Open Elements GmbH
Sept 2024 – present

Software Engineer · remote

- **Hiero (LF Decentralized Trust)** — contributor to the Hiero JavaScript SDK, the most widely used of the Hiero SDKs, and committer with review and merge rights in the Hiero project. All work reviewed in public under Apache-2.0 open governance.
- **EUDIPLO (LF Decentralized Trust)** — contributor to the open-source middleware bridging backend systems to European Digital Identity Wallets, wrapping OID4VCI, OID4VP and SD-JWT VC behind a unified API. TypeScript and NestJS, distributed as Docker images.
- Build and maintain the Hiero platform site in Next.js and TypeScript — component architecture, theming and content tooling for the project's developer-facing surface.
- Develop and document reusable UI components in Storybook across the organisation's products.
- Work asynchronously in a geographically distributed team across European and East African time zones.

Timato GmbH
Apr 2024 – Sept 2025

Front-end Developer, part-time · remote

- Built a case management application for a law practice in Vue.js — a stateful, data-dense internal application with complex forms, record relationships and REST integration, owned from first component through to release.

OpenMRS
2022 – present

Open-source contributor; Google Summer of Code contributor 2023 and 2024 · remote

- Ongoing contributor to the OpenMRS 3 **micro-frontend platform** — a modular electronic medical record system assembled from independently deployed modules, used by health implementations worldwide.
- Designed and shipped a new module for clinician–patient SMS messaging: React and TypeScript, integrated with a backend REST API, form state and schema validation with React-Hook-Form and Zod, internationalised with i18next, and extended through the platform's runtime extension system so implementations can reconfigure the UI without forking it.
- Implemented responsive and tablet layouts against an IBM Carbon-based design system — **18 merged pull requests** across openmrs-esm-patient-chart, openmrs-esm-patient-management and openmrs-esm-core.

WEB3 PROJECTS AND MAINTAINERSHIP

Hiero Enterprise JS
creator, maintainer

TypeScript monorepo, Apache-2.0 · github.com/hiero-hackers/hiero-enterprise-js

- Created and maintain a five-package TypeScript library giving Node.js services typed access to a distributed ledger — accounts, fungible tokens, NFTs, smart contracts, consensus topics, scheduled transactions and key management — with no client setup.
- Separates the write path (network client and operator key custody) from a zero-dependency mirror-node read client with complete typed coverage of a 47-endpoint REST API, continuable pagination, time-series filters and pro-active rate limiting.
- Native adapters for Express, Fastify and NestJS, so a service gets ledger access through its existing dependency injection.
- Published to npm with build provenance, signed release tags, mandatory DCO sign-off and GPG-signed commits, CI coverage gates and an OpenSSF Scorecard.
- Winning entry for the Hiero bounty at the Hedera Hello Future: Apex hackathon, 2026.

Dino — DApp with on-chain asset ownership
github.com/Jexsie/DINO

- A decentralized application built around real asset ownership: players connect a **HashPack** wallet over **WalletConnect**, apply NFT skins they hold to re-theme the running game, and mint an NFT through a smart contract on beating the high score.
- Signing authority stays with the wallet — every transaction is presented in full before approval, with no operator keys on the client. Ownership state is verifiable on the mirror node independently of the application.

EUDIPLO — LF Decentralized Trust
contributor

EUDI Wallet integration middleware, Apache-2.0 · github.com/EUDIPLO/eudiplo

- Contribute to open-source middleware that lets government agencies, universities, hospitals and enterprises issue and verify digital credentials against the European Digital Identity Wallet ecosystem without implementing the identity protocol stack themselves.

RECOGNITION, SPEAKING AND CERTIFICATION

- **Hiero bounty winner** — Hedera Hello Future: Apex hackathon, 2026.
- **Track winner** — Hedera Hello Future Hackathon 2.0, 2024, Hashgraph Explorers track, as Noobsoft Gamers.
- Selected twice for **Google Summer of Code** with OpenMRS — 2023 and 2024.
- Speaker, **Adoptium Summit 2025** (Eclipse Foundation) — "Open Source Impact on the Global South", co-presented with Noah Tayebwa.
- Advanced Web3 Wallet Security · Web3 Wallet Security Basics · Blockchain Basics — Cyfrin Updraft, 2025–2026.
- Hedera Business Foundation, 2026 · Hashgraph Developer Course, 2025 — The Hashgraph Association.
- Understanding the EU Cyber Resilience Act (CRA) — Linux Foundation / OpenSSF, 2026.

SKILLS

Ledger and Web3	Hiero and Hedera SDKs, mirror node REST APIs, fungible token and NFT lifecycles, consensus service topics, scheduled transactions, key management, EVM and Ethereum-compatible smart contracts, Solidity, WalletConnect, HashPack, DApp architecture
Decentralized identity	EUDI Wallet ecosystem, verifiable credentials, OID4VCI, OID4VP, SD-JWT VC
Languages	TypeScript, JavaScript, Solidity, HTML, CSS, Sass/SCSS; Java (basic)
Back end and services	Node.js, NestJS, Express, Fastify, REST API design, OpenAPI, Docker
Front end	React, Next.js, Vue.js, React Native, Tailwind CSS, micro-frontends with single-spa, Storybook, design-system implementation, complex stateful and transaction-driven interfaces
Testing and delivery	Jest, end-to-end testing with Cypress, Playwright and Selenium, GitHub Actions CI/CD, pnpm monorepos, npm publishing with provenance, DCO and GPG-signed commits, OpenSSF Scorecard
Languages spoken	English and Luganda fluently, Swahili conversationally
